

Is it possible to run session-messenger on Tails 6.9 with the help of the add-on ?  
Yes :-) It works like the following screenshot shows

Is session-messenger installed on Tails 6.9 ?

No. It is installed on a remote server that is connected over a socks5 server  
Inside Tails 6.9 it is not possible to run session directly for the following reasons.  
This program needs multiple UDP Ports to work properly. Tails not support any outgoing UDP Ports so this program will never work

Is it possible to make phone-calls ?  
No

Is it possible to write messages ?  
Yes

Is it possible to send files ?  
Yes .... But you have to transfer the file to remote server

Are there any plans to implement phone calls ?  
No. The main problem would be the speed.

Are there any plans to send local files from tails over session ?  
If sshfs works fine and have enough speed ... I will implement this feature, otherwise No
